1 Notes on this attachment to the user manual

This attachment to the RCM 202-AB user manual is intended exclusively for use by trained specialist personnel in the field of electrical engineering. It describes the Modbus connection of the RCM 202-AB.

It is essential the user manual of the RCM 202-AB is observed.

This system, like the user manual, is part of the product and refers in part to other devices from Janitza electronics GmbH.

2 Modbus

2.1 Modbus function (master)

The RCM 202-AB does not support master functions for Modbus.

2.2 Modbus function (slave)

The RCM 202-AB supports the following Modbus functions as a slave:

Function codes (FC)	Meaning
0x03 (03)	Read holding register
0x06 (06)	Write single register
0x10 (16)	Write multiple register
0x17 (23)	Read/write multiple registers

Tab. 1: Function codes

With the help of the exception codes it is possible to limit certain errors during the communication between the Modbus nodes and to stop them if necessary.

Exception codes	Meaning
0x01	Unauthorized function
0x02	Unauthorized data address
0x03	Unauthorized data value
0x04	Device error (slave)

Tab. 2: Exception codes

2.3 Transmission parameters

The RCM 202-AB supports the following transmission parameters:

Baud rate (baud)	9600, 19200, 38400, 57600 and 115200
Data bits	8
Parity	None
Internal stop bits	1

2.4 Byte order

The data in the Modbus address list can be retrieved in big-endian format (high byte before low byte).

The addresses described in this address list return the data in "big-endian" format.

2.5 Update rate

The Modbus register addresses are updated every 200 ms.

2.6 Number formats

Type	Size	Minimum	Maximum
char	8 bit	0	255
byte	8 bit	-128	127
short	16 bit	-2^{15}	$2^{15}-1$
int	32 bit	-2^{31}	$2^{31}-1$
uint	32 bit	0	$2^{32}-1$
long64	64 bit	-2^{63}	$2^{63}-1$
float	32 bit	IEEE 754	IEEE 754
double	64 bit	IEEE 754	IEEE 754
